**CHAPTER
ONE**

NETWORKING-BAREMETAL PLUGIN

This project's goal is to provide deep integration between the Networking service and the Bare Metal service and advanced networking features like notifications of port status changes and routed networks support in clouds with Bare Metal service.

- Free software: Apache license
- Documentation: <http://docs.openstack.org/networking-baremetal/latest>
- Source: <http://opendev.org/openstack/networking-baremetal>
- Bugs: <https://bugs.launchpad.net/networking-baremetal>
- Release notes: <https://docs.openstack.org/releasenotes/networking-baremetal/>

CHAPTER
TWO

INSTALLATION GUIDE

2.1 Installation

This section describes how to install and configure the `networking-baremetal` plugin and `ironic-neutron-agent`.

The `ironic-neutron-agent` is a neutron agent that populates the host to physical network mapping for baremetal nodes in neutron. Neutron uses this to calculate the segment to host mapping information.

2.1.1 Install the networking-baremetal plugin and agent

At the command line:

```
$ pip install networking-baremetal
```

Or, if you have neutron installed in a virtualenv, install the `networking-baremetal` plugin to the same virtualenv:

```
$ . <path-to-neutron-venv>/bin/activate
$ pip install networking-baremetal
```

Or, use the package from your distribution. For RHEL7/CentOS7:

```
$ yum install python2-networking-baremetal python2-ironic-neutron-agent
```

2.1.2 Enable baremetal mechanism driver in the Networking service

To enable mechanism drivers in the ML2 plug-in, edit the `/etc/neutron/plugins/ml2/ml2_conf.ini` configuration file. For example, this enables the `openvswitch` and `baremetal` mechanism drivers:

```
[ml2]
mechanism_drivers = openvswitch,baremetal
```

2.1.3 Add devices (switches) to manage

The baremetal mechanism ML2 plug-in provides a device driver plug-in interface. If a device driver for the switch model exist the baremetal ML2 plug-in can be configured to manage switch configuration, adding tenant VLANs and setting switch port VLAN configuration etc.

To add a device to manage, edit the `/etc/neutron/plugins/ml2/ml2_conf.ini` configuration file. The example below enables devices: `device_a.example.net` and `device_b.example.net`. Both devices in the example is using the `netconf-openconfig` device driver. For each device a separate section in configuration defines the device and driver specific configuration.

```
[networking_baremetal]
enabled_devices = device_a.example.net,device_b.example.net

[device_a.example.net]
driver = netconf-openconfig
switch_info = device_a
switch_id = 00:53:00:0a:0a:0a
host = device_a.example.net
username = user
key_filename = /etc/neutron/ssh_keys/device_a_sshkey
hostkey_verify = false

[device_b.example.net]
driver = netconf-openconfig
switch_info = device_b
switch_id = 00:53:00:0b:0b:0b
host = device_a.example.net
username = user
key_filename = /etc/neutron/ssh_keys/device_a_sshkey
hostkey_verify = false
```

2.1.4 Configure ironic-neutron-agent

To configure the baremetal neutron agent, edit the neutron configuration `/etc/neutron/plugins/ml2/ironic_neutron_agent.ini` file. Add an `[ironic]` section. For example:

```
[ironic]
project_domain_name = Default
project_name = service
user_domain_name = Default
password = password
username = ironic
auth_url = http://identity-server.example.com/identity
auth_type = password
os_region = RegionOne
```

2.1.5 Start ironic-neutron-agent service

To start the agent either run it from the command line like in the example below or add it to the init system.

```
$ ironic-neutron-agent \
  --config-dir /etc/neutron \
  --config-file /etc/neutron/plugins/ml2/ironic_neutron_agent.ini \
  --log-file /var/log/neutron/ironic_neutron_agent.log
```

You can create a systemd service file `/etc/systemd/system/ironic-neutron-agent.service` for `ironic-neutron-agent` for systemd based distributions. For example:

```
[Unit]
Description=OpenStack Ironic Neutron Agent
After=syslog.target network.target

[Service]
Type=simple
User=neutron
PermissionsStartOnly=true
TimeoutStartSec=0
Restart=on-failure
ExecStart=/usr/bin/ironic-neutron-agent --config-dir /etc/neutron --config-
        -file /etc/neutron/plugins/ml2/ironic_neutron_agent.ini --log-file /var/log/
        -neutron/ironic-neutron-agent.log
PrivateTmp=true
KillMode=process

[Install]
WantedBy=multi-user.target
```

Note: systemd service file may be already available if you are installing from package released by linux distributions.

Enable and start the `ironic-neutron-agent` service:

```
$ sudo systemctl enable ironic-neutron-agent.service
$ sudo systemctl start ironic-neutron-agent.service
```

CONFIGURATION GUIDE

3.1 Configuration Options

3.1.1 Configuration Reference

The following pages describe configuration options that can be used to adjust the `ironic-neutron-agent` service to your particular situation.

ironic-neutron-agent - Configuration Options

The following is an overview of all available configuration options in networking-baremetal. For a sample configuration file, refer to [Sample Configuration File](#).

DEFAULT

debug

Type

boolean

Default

False

Mutable

This option can be changed without restarting.

If set to true, the logging level will be set to DEBUG instead of the default INFO level.

log_config_append

Type

string

Default

<None>

Mutable

This option can be changed without restarting.

The name of a logging configuration file. This file is appended to any existing logging configuration files. For details about logging configuration files, see the Python logging module documentation.

Note that when logging configuration files are used then all logging configuration is set in the configuration file and other logging configuration options are ignored (for example, log-date-format).

Table 1: Deprecated Variations

| Group | Name |
|---------|------------|
| DEFAULT | log-config |
| DEFAULT | log_config |

`log_date_format`

Type

string

Default

`%Y-%m-%d %H:%M:%S`

Defines the format string for %(asctime)s in log records. Default: the value above . This option is ignored if log_config_append is set.

`log_file`

Type

string

Default

`<None>`

(Optional) Name of log file to send logging output to. If no default is set, logging will go to stderr as defined by use_stderr. This option is ignored if log_config_append is set.

Table 2: Deprecated Variations

| Group | Name |
|---------|---------|
| DEFAULT | logfile |

`log_dir`

Type

string

Default

`<None>`

(Optional) The base directory used for relative log_file paths. This option is ignored if log_config_append is set.

Table 3: Deprecated Variations

| Group | Name |
|---------|--------|
| DEFAULT | logdir |

watch_log_file

Type

boolean

Default

False

Uses logging handler designed to watch file system. When log file is moved or removed this handler will open a new log file with specified path instantaneously. It makes sense only if log_file option is specified and Linux platform is used. This option is ignored if log_config_append is set.

use_syslog

Type

boolean

Default

False

Use syslog for logging. Existing syslog format is DEPRECATED and will be changed later to honor RFC5424. This option is ignored if log_config_append is set.

use_journal

Type

boolean

Default

False

Enable journald for logging. If running in a systemd environment you may wish to enable journal support. Doing so will use the journal native protocol which includes structured metadata in addition to log messages. This option is ignored if log_config_append is set.

syslog_log_facility

Type

string

Default

LOG_USER

Syslog facility to receive log lines. This option is ignored if log_config_append is set.

use_json

Type

boolean

Default

False

Use JSON formatting for logging. This option is ignored if log_config_append is set.

use_stderr

Type

boolean

Default

False

Log output to standard error. This option is ignored if log_config_append is set.

use_eventlog

Type

boolean

Default

False

Log output to Windows Event Log.

Warning: This option is deprecated for removal. Its value may be silently ignored in the future.

Reason

Windows support is no longer maintained.

log_rotate_interval

Type

integer

Default

1

The amount of time before the log files are rotated. This option is ignored unless log_rotation_type is set to interval.

log_rotate_interval_type

Type

string

Default

days

Valid Values

Seconds, Minutes, Hours, Days, Weekday, Midnight

Rotation interval type. The time of the last file change (or the time when the service was started) is used when scheduling the next rotation.

max_logfile_count

Type

integer

Default

30

Maximum number of rotated log files.

max_logfile_size_mb

Type
integer

Default
200

Log file maximum size in MB. This option is ignored if log_rotation_type is not set to size.

log_rotation_type

Type
string

Default
none

Valid Values
interval, size, none

Log rotation type.

Possible values

interval

Rotate logs at predefined time intervals.

size

Rotate logs once they reach a predefined size.

none

Do not rotate log files.

logging_context_format_string

Type
string

Default
%{asctime}s.%{msecs}03d %{process)d %{levelname)s %{name)s
[%{global_request_id)s %{request_id)s %{user_identity)s]
%{instance)s%{message)s

Format string to use for log messages with context. Used by oslo_log.formatters.ContextFormatter

logging_default_format_string

Type
string

Default
%{asctime)s.%{msecs}03d %{process)d %{levelname)s %{name)s [-]
%{instance)s%{message)s

Format string to use for log messages when context is undefined. Used by oslo_log.formatters.ContextFormatter

`logging_debug_format_suffix`

Type

string

Default

`%(funcName)s %(pathname)s:%(lineno)d`

Additional data to append to log message when logging level for the message is DEBUG. Used by oslo_log.formatters.ContextFormatter

`logging_exception_prefix`

Type

string

Default

`%(asctime)s.%(msecs)03d %(process)d ERROR %(name)s
%(instance)s`

Prefix each line of exception output with this format. Used by oslo_log.formatters.ContextFormatter

`logging_user_identity_format`

Type

string

Default

`%(user)s %(project)s %(domain)s %(system_scope)s
%(user_domain)s %(project_domain)s`

Defines the format string for %(user_identity)s that is used in logging_context_format_string. Used by oslo_log.formatters.ContextFormatter

`default_log_levels`

Type

list

Default

```
['amqp=WARN', 'amqplib=WARN', 'boto=WARN', 'qpid=WARN',
 'sqlalchemy=WARN', 'suds=INFO', 'oslo.messaging=INFO',
 'oslo.messaging=INFO', 'iso8601=WARN', 'requests.packages.
urllib3.connectionpool=WARN', 'urllib3.connectionpool=WARN',
 'websocket=WARN', 'requests.packages.urllib3.util.retry=WARN',
 'urllib3.util.retry=WARN', 'keystonemiddleware=WARN',
 'routes.middleware=WARN', 'stevedore=WARN', 'taskflow=WARN',
 'keystoneauth=WARN', 'oslo.cache=INFO', 'oslo_policy=INFO',
 'dogpile.core.dogpile=INFO']
```

List of package logging levels in logger=LEVEL pairs. This option is ignored if log_config_append is set.

`publish_errors`

Type

boolean

Default

False

Enables or disables publication of error events.

instance_format**Type**

string

Default

"[instance: %(uuid)s] "

The format for an instance that is passed with the log message.

instance_uuid_format**Type**

string

Default

"[instance: %(uuid)s] "

The format for an instance UUID that is passed with the log message.

rate_limit_interval**Type**

integer

Default

0

Interval, number of seconds, of log rate limiting.

rate_limit_burst**Type**

integer

Default

0

Maximum number of logged messages per rate_limit_interval.

rate_limit_except_level**Type**

string

Default

CRITICAL

Log level name used by rate limiting: CRITICAL, ERROR, INFO, WARNING, DEBUG or empty string. Logs with level greater or equal to rate_limit_except_level are not filtered. An empty string means that all levels are filtered.

fatal_deprecations**Type**

boolean

Default

False

Enables or disables fatal status of deprecations.

agent

report_interval

Type

floating point

Default

30

Seconds between nodes reporting state to server; should be less than agent_down_time, best if it is half or less than agent_down_time.

log_agent_heartbeats

Type

boolean

Default

False

Log agent heartbeats

ironic

auth_strategy

Type

string

Default

keystone

Valid Values

keystone, noauth

Method to use for authentication: noauth or keystone.

Warning: This option is deprecated for removal. Its value may be silently ignored in the future.

Reason

This option is no longer used, please use the [ironic]/auth_type option instead.

service_type

Type

string

Default

<None>

The default service_type for endpoint URL discovery.

service_name**Type**

string

Default

<None>

The default service_name for endpoint URL discovery.

valid_interfaces**Type**

list

Default

<None>

List of interfaces, in order of preference, for endpoint URL.

region_name**Type**

string

Default

<None>

The default region_name for endpoint URL discovery.

Table 4: Deprecated Variations

| Group | Name |
|--------|-----------|
| ironic | os_region |

endpoint_override**Type**

string

Default

<None>

Always use this endpoint URL for requests for this client. NOTE: The unversioned endpoint should be specified here; to request a particular API version, use the *version*, *min-version*, and/or *max-version* options.

Table 5: Deprecated Variations

| Group | Name |
|--------|------------|
| ironic | ironic_url |

version

Type

string

Default

<None>

Minimum Major API version within a given Major API version for endpoint URL discovery. Mutually exclusive with min_version and max_version

min_version

Type

string

Default

<None>

The minimum major version of a given API, intended to be used as the lower bound of a range with max_version. Mutually exclusive with version. If min_version is given with no max_version it is as if max version is latest.

max_version

Type

string

Default

<None>

The maximum major version of a given API, intended to be used as the upper bound of a range with min_version. Mutually exclusive with version.

connect_retries

Type

integer

Default

<None>

The maximum number of retries that should be attempted for connection errors.

connect_retry_delay

Type

floating point

Default

<None>

Delay (in seconds) between two retries for connection errors. If not set, exponential retry starting with 0.5 seconds up to a maximum of 60 seconds is used.

status_code_retries

Type

integer

Default

<None>

The maximum number of retries that should be attempted for retriable HTTP status codes.

Table 6: Deprecated Variations

| Group | Name |
|--------|-------------|
| ironic | max_retries |

status_code_retry_delay**Type**

floating point

Default

<None>

Delay (in seconds) between two retries for retriable status codes. If not set, exponential retry starting with 0.5 seconds up to a maximum of 60 seconds is used.

Table 7: Deprecated Variations

| Group | Name |
|--------|----------------|
| ironic | retry_interval |

retriable_status_codes**Type**

list

Default

<None>

List of retriable HTTP status codes that should be retried. If not set default to [503]

interface**Type**

string

Default

<None>

The default interface for endpoint URL discovery.

Warning: This option is deprecated for removal. Its value may be silently ignored in the future.

Reason

Using valid-interfaces is preferable because it is capable of accepting a list of possible interfaces.

cafile

Type
string

Default
<None>

PEM encoded Certificate Authority to use when verifying HTTPs connections.

certfile

Type
string

Default
<None>

PEM encoded client certificate cert file

keyfile

Type
string

Default
<None>

PEM encoded client certificate key file

insecure

Type
boolean

Default
False

Verify HTTPS connections.

timeout

Type
integer

Default
<None>

Timeout value for http requests

collect_timing

Type
boolean

Default
False

Collect per-API call timing information.

split_loggers

Type

boolean

Default

False

Log requests to multiple loggers.

auth_url

Type

unknown type

Default

<None>

Authentication URL

system_scope

Type

unknown type

Default

<None>

Scope for system operations

domain_id

Type

unknown type

Default

<None>

Domain ID to scope to

domain_name

Type

unknown type

Default

<None>

Domain name to scope to

project_id

Type

unknown type

Default

<None>

Project ID to scope to

project_name

Type

unknown type

Default

<None>

Project name to scope to

project_domain_id

Type

unknown type

Default

<None>

Domain ID containing project

project_domain_name

Type

unknown type

Default

<None>

Domain name containing project

trust_id

Type

unknown type

Default

<None>

ID of the trust to use as a trustee use

user_id

Type

unknown type

Default

<None>

User ID

username

Type

unknown type

Default

<None>

Username

Table 8: Deprecated Variations

| Group | Name |
|--------|-----------|
| ironic | user-name |
| ironic | user_name |

user_domain_id

Type
unknown type

Default
<None>

Users domain id

user_domain_name

Type
unknown type

Default
<None>

Users domain name

password

Type
unknown type

Default
<None>

Users password

Sample Configuration File

The following is a sample ironic-neutron-agent configuration for adaptation and use. For a detailed overview of all available configuration options, refer to [ironic-neutron-agent - Configuration Options](#).

The sample configuration can also be viewed in `file` form.

Important: The sample configuration file is auto-generated from networking-baremetal when this documentation is built. You must ensure your version of networking-baremetal matches the version of this documentation.

```
[DEFAULT]

#
# From oslo.log
#
```

```

3.1.2 Configuration Reference

The following pages describe configuration options that can be used to adjust the neutron ML2 configuration and the baremetal ML2 plug-in and device drivers to your particular situation.

To enable mechanism drivers in the ML2 plug-in, edit the `/etc/neutron/plugins/ml2/ml2_conf.ini` configuration file. For example, this enables the `openvswitch` and `baremetal` mechanism drivers:

```
[ml2]
mechanism_drivers = openvswitch,baremetal
```

To add a device to manage, edit the `/etc/neutron/plugins/ml2/ml2_conf.ini` configuration file. The example below enables devices: `device_a.example.net` and `device_b.example.net`. For each device a separate section in the same configuration file defines the device and driver specific configuration. Please refer to [Device drivers](#) for details.

```
[networking_baremetal]
enabled_device = device_a.example.net,device_b.example.net
```

Device drivers

The baremetal mechanism ML2 plug-in provides a device driver plug-in interface, this interface can be used to add device (switch) configuration capabilities. The interface uses `stevedore` for dynamic loading.

Individual drivers may have independent configuration requirements depending on the implementation. [*Driver specific options*](#) are documented separately.

Common configuration options for all device drivers

This page describes configuration options that is common to all networking- baremetal device drivers. Individual drivers may have independent configuration requirements depending on the implementation, refer to the device driver specific documentation.

Configuration options

`common-example`

`driver`

Type
string

Default
`<None>`

The driver to use when configuring the device

`switch_id`

Type
string

Default

<None>

The switch ID, MAC address of the device.

switch_info

Type

string

Default

<None>

Optional string field to be used to store any vendor-specific information.

physical_networks

Type

list

Default

[]

A list of physical networks mapped to this device.

manage_vlans

Type

boolean

Default

True

Set this to False for the device if VLANs should not be created and deleted on the device.

networking_baremetal

enabled_devices

Type

list

Default

['common-example', 'netconf-openconfig-example']

This option has a sample default set, which means that its actual default value may vary from the one documented above.

Enabled devices for which the plugin should manage configuration. Driver specific configuration for each device must be added in separate sections.

Sample Configuration File

The following is a sample configuration section that would be added to `/etc/neutron/plugins/ml2/ml2_conf.ini`.

The sample configuration can also be viewed in `file form`.

Important: The sample configuration file is auto-generated from networking-baremetal when this documentation is built. You must ensure your version of networking-baremetal matches the version of this documentation.

```
[DEFAULT]

[common-example]

#
# From common-device-driver-opts

#switch_id = <None>

# Optional string field to be used to store any vendor-specific information.
# (string value)
#switch_info = <None>

# A list of physical networks mapped to this device. (list value)
#physical_networks =

# Set this to False for the device if VLANs should not be created and deleted.
#on
# the device. (boolean value)
#manage_vlans = true

[networking_baremetal]

#
# From common-device-driver-opts
#

# Enabled devices for which the plugin should manage configuration. Driver
# specific configuration for each device must be added in separate sections.
# (list value)
#
```

(continues on next page)

(continued from previous page)

```
# This option has a sample default set, which means that
# its actual default value may vary from the one documented
# below.
#enabled_devices = common-example,netconf-openconfig-example
```

Available device drivers

Device driver - netconf-openconfig

The `netconf-openconfig` device driver uses the Network Configuration Protocol (NETCONF) and open source vendor-neutral `OpenConfig` YANG models.

This driver has been tested with the following switch vendor/operating systems:

- Cisco NXOS
- Arista vEOS

Example configuration for Cisco NXOS device:

```
[networking_baremetal]
enabled_devices = nexus.example.net

[nexus.example.net]
driver = netconf-openconfig
device_params = name:nexus
switch_info = nexus
switch_id = 00:53:00:0a:0a:0a
host = nexus.example.net
username = user
key_filename = /etc/neutron/ssh_keys/nexus_sshkey
```

Example configuration for Arista EOS device:

```
[networking_baremetal]
enabled_devices = arista.example.net

[arista.example.net]
driver = netconf-openconfig
device_params = name:default
switch_info = arista
switch_id = 00:53:00:0b:0b:0b
host = arista.example.net
username = user
key_filename = /etc/neutron/ssh_keys/arista_sshkey
```

Configuration options

netconf-openconfig-example

driver

Type

string

Default

<None>

The driver to use when configuring the device

switch_id

Type

string

Default

<None>

The switch ID, MAC address of the device.

switch_info

Type

string

Default

<None>

Optional string field to be used to store any vendor-specific information.

physical_networks

Type

list

Default

[]

A list of physical networks mapped to this device.

manage_vlans

Type

boolean

Default

True

Set this to False for the device if VLANs should not be created and deleted on the device.

network_instance

Type

string

Default

default

Advanced Option

Intended for advanced users and not used by the majority of users, and might have a significant effect on stability and/or performance.

The L2, L3, or L2+L3 forwarding instance to use when defining VLANs on the device.

port_id_re_sub

Type

dict

Default

{'pattern': 'Ethernet', 'repl': 'eth'}

This option has a sample default set, which means that its actual default value may vary from the one documented above.

Regular expression pattern and replacement string. Some devices do not use the port description from LLDP in Netconf configuration. If the regular expression pattern and replacement string is set the port_id will be modified before passing configuration to the device.

disabled_properties

Type

list

Default

[]

A list of properties that should not be used, currently only port_mtu is valid

manage_lacp_aggregates

Type

boolean

Default

True

When set to true the driver will manage LACP aggregates if link_group_information is defined in the binding:profile. When this is false the driver expect the link aggregation to be pre-configured on the device, and only perform vlan plugging.

link_aggregate_prefix

Type

string

Default

Port-Channel

The device specific prefix used for link-aggregation ports. Common values: po, port-channel or Port-Channel.

link_aggregate_range

Type

string

Default

1000..2000

Range of link aggregation interface IDs that the driver can use when managing link aggregates.

host**Type**

string

Default

device.example.com

This option has a sample default set, which means that its actual default value may vary from the one documented above.

The hostname or IP address to use for connecting to the netconf device.

username**Type**

string

Default

netconf

This option has a sample default set, which means that its actual default value may vary from the one documented above.

The username to use for SSH authentication.

port**Type**

integer

Default

830

The port to use for connection to the netconf device.

password**Type**

string

Default

secret

This option has a sample default set, which means that its actual default value may vary from the one documented above.

The password used if using password authentication, or the passphrase to use for unlocking keys that require it. (To disable attempting key authentication altogether, set options *allow_agent* and *look_for_keys* to *False*.)

key_filename**Type**

string

Default

~/.ssh/id_rsa

Private key filename

hostkey_verify

Type

boolean

Default

True

Enables hostkey verification from `~/.ssh/known_hosts`

device_params

Type

dict

Default

`{'name': 'default'}`

ncclient device handler parameters, see ncclient documentation for supported device handlers.

allow_agent

Type

boolean

Default

True

Enables querying SSH agent (if found) for keys.

look_for_keys

Type

boolean

Default

True

Enables looking in the usual locations for ssh keys (e.g. `~/.ssh/id_*`)

networking_baremetal

enabled_devices

Type

list

Default

`['common-example', 'netconf-openconfig-example']`

This option has a sample default set, which means that its actual default value may vary from the one documented above.

Enabled devices for which the plugin should manage configuration. Driver specific configuration for each device must be added in separate sections.

Sample Configuration File

The following is a sample configuration section that would be added to `/etc/neutron/plugins/ml2/ml2_conf.ini`.

The sample configuration can also be viewed in `file form`.

Important: The sample configuration file is auto-generated from networking-baremetal when this documentation is built. You must ensure your version of networking-baremetal matches the version of this documentation.

CONTRIBUTOR GUIDE

4.1 Contributing

This document provides some necessary points for developers to consider when writing and reviewing networking-baremetal code.

4.1.1 Getting Started

If you're completely new to OpenStack and want to contribute to the networking-baremetal project, please start by familiarizing yourself with the [Infra Teams Developer Guide](#). This will help you get your accounts set up in Launchpad and Gerrit, familiarize you with the workflow for the OpenStack continuous integration and testing systems, and help you with your first commit.

LaunchPad Project

Most of the tools used for OpenStack require a launchpad.net ID for authentication.

See also:

- <https://launchpad.net>
- <https://launchpad.net/ironic>

Related Projects

Networking Baremetal is tightly integrated with the ironic and neutron projects. Ironic and its related projects are developed by the same community.

4.1.2 Developer quick-starts

These are quick walk throughs to get you started developing code for networking-baremetal. These assume you are already familiar with submitting code reviews to an OpenStack project.

Deploying networking-baremetal with DevStack

DevStack may be configured to deploy networking-baremetal Networking service plugin. It is highly recommended to deploy on an expendable virtual machine and not on your personal work station. Deploying networking-baremetal with DevStack requires a machine running Ubuntu 14.04 (or later) or Fedora 20 (or later).

See also:

<http://docs.openstack.org/devstack/latest>

Create devstack/local.conf with minimal settings required to enable networking-baremetal with ironic. Here is an example of local.conf:

```
cd devstack
cat >local.conf <<END
[[local|localrc]]
# Credentials
ADMIN_PASSWORD=password
DATABASE_PASSWORD=password
RABBIT_PASSWORD=password
SERVICE_PASSWORD=password
SERVICE_TOKEN=password
SWIFT_HASH=password
SWIFT_TEMPURL_KEY=password

# Enable networking-baremetal plugin
enable_plugin networking-baremetal https://opendev.org/openstack/networking-
baremetal.git
enable_service ir-neutronagn

# Enable ironic plugin
enable_plugin ironic https://opendev.org/openstack/ironic
```

(continues on next page)

(continued from previous page)

```
enable_service networking_baremetal

# Enable neutron which is required by ironic and disable nova-network.
disable_service n-net
disable_service n-novnc
enable_service q-svc
enable_service q-agt

```

Deploying networking-baremetal and multi-tenant networking with DevStack

DevStack may be configured to deploy networking-baremetal Networking service plugin together with networking-generic-switch for multi-tenant networking. It is highly recommended to deploy on an expendable virtual machine and not on your personal work station. Deploying networking-baremetal with DevStack requires a machine running Ubuntu 14.04 (or later) or Fedora 20 (or later).

    edit_config(config)
        Edit configuration on the device

        Parameters
            config The configuration to apply to the device

    get(**kwargs)
        Get current configuration/state from device

    get_client_args()
        Get client connection arguments from configuration
```

```
class networking_baremetal.drivers.base.BaseDeviceDriver(device)
```

Bases: object

```
SUPPORTED_BOND_MODES = {}
```

```
create_network(context)
```

Create network on device

Parameters

context NetworkContext instance describing the new network.

```
create_port(context, segment, links)
```

Create/Configure port on device

Parameters

- **context** PortContext instance describing the new state of the port, as well as the original state prior to the update_port call.
- **segment** segment dictionary describing segment to bind
- **links** Local link information filtered for the device.

```
delete_network(context)
```

Delete network on device

Parameters

context NetworkContext instance describing the new network.

```
delete_port(context, links, current=True)
```

Delete/Un-configure port on device

Parameters

- **context** PortContext instance describing the new state of the port, as well as the original state prior to the update_port call.
- **links** Local link information filtered for the device.
- **current** Boolean, when true use context.current, when false use context.original

```
load_config()
```

Register driver specific configuration

All drivers should register driver specific options in the device specific config group. This method will be called during mechanism driver initialization.

```
update_network(context)
```

Update network on device

Parameters

context NetworkContext instance describing the new network.

```
update_port(context, links)
```

Update port on device

Parameters

- **context** PortContext instance describing the new state of the port, as well as the original state prior to the update_port call.

- **links** Local link information filtered for the device.

validate()

Driver validation

This method will be called during mechanism driver initialization. Raising any exception other than `DriverValidationError` will cause service initialization failure.

Raises

`DriverValidationError` On validation failure.

property interval

The period between LACP messages

property lacp_mode

The LACP mode if the aggregate interface

property name

The name of the interface.

property operation

RFC 6241 - <edit-config> operation attribute

to_xml_element()

Create XML Element

Returns

ElementTree Element with SubElements

```
class networking_baremetal.openconfig.lacp.lacp.LACPIInterfaces
```

Bases: Collection

Top-level grouping for LACP-enabled interfaces

NAMESPACE = 'http://openconfig.net/yang/lacp'

PARENT = 'lacp'

TAG = 'interfaces'

`add(name: str)`

Add interface

Parameters

`name` Interface name

Type

str

`property interfaces`

List of interfaces

`to_xml_element()`

Create XML Element

Returns

ElementTree Element with SubElements

[networking_baremetal.openconfig.lacp.types module](#)

`class networking_baremetal.openconfig.lacp.types.LACPActivity(value)`

Bases: Enum

Describes the LACP membership type

Active or passive, of the interface in the aggregate. reference IEEE 802.1AX-2008

ACTIVE: Interface is an active member, i.e., will detect and maintain aggregates

PASSIVE: Interface is a passive member, i.e., it participates with an active partner

ACTIVE = 'ACTIVE'

PASSIVE = 'PASSIVE'

`class networking_baremetal.openconfig.lacp.types.LACPPeriod(value)`

Bases: Enum

Defines the time between sending LACP messages

reference IEEE 802.3ad FAST: Send LACP packets every second SLOW: Send LACP packets every 30 seconds

FAST = 'FAST'

SLOW = 'SLOW'

Module contents

`networking_baremetal.openconfig.network_instance package`

Submodules

`networking_baremetal.openconfig.network_instance.network_instance module`

```
class networking_baremetal.openconfig.network_instance.network_instance.NetworkInstance(name)
```

Bases: object

An OpenConfig description of a network_instance.

This may be a Layer 3 forwarding construct such as a virtual routing and forwarding (VRF) instance, or a Layer 2 instance such as a virtual switch instance (VSI). Mixed Layer 2 and Layer 3 instances are also supported.

```
NAMESPACE = 'http://openconfig.net/yang/network-instance'
```

```
TAG = 'network-instance'
```

```
property name
```

A unique name identifying the network instance

```
to_xml_element()
```

Create XML Element

Returns

ElementTree Element with SubElements

```
property vlans
```

Group/List of VLANs - keyed by id

```
class networking_baremetal.openconfig.network_instance.network_instance.NetworkInstances
```

Bases: Collection

Top-level grouping containing a list of network instances.

```
NAMESPACE = 'http://openconfig.net/yang/network-instance'
```

```
TAG = 'network-instances'
```

```
add(name: str)
```

Add network instance

Parameters

name A unique name identifying the network instance

Type

str

Keyword arguments

Network instance arguments

```
property network_instances
```

`to_xml_element()`
Create XML Element

Returns
ElementTree Element with SubElements

class `networking_baremetal.plugins.ml2.baremetal_mech.BaremetalMechanismDriver`

Bases: `SimpleAgentMechanismDriverBase`

property connectivity

Return the mechanism driver connectivity type

The possible values are l2, l3 and legacy (default).

Returns

a string in (l2, l3, legacy)

create_network_postcommit(*context*)

Create a network.

Called after the transaction commits. Call can block, though will block the entire process so care should be taken to not drastically affect performance. Raising an exception will cause the deletion of the resource.

Parameters

context `NetworkContext` instance describing the new network.

create_network_precommit(*context*)

Allocate resources for a new network.

Create a new network, allocating resources as necessary in the database. Called inside transaction context on session. Call cannot block. Raising an exception will result in a rollback of the current transaction.

Parameters

context `NetworkContext` instance describing the new network.

create_port_postcommit(*context*)

Create a port.

Called after the transaction completes. Call can block, though will block the entire process so care should be taken to not drastically affect performance. Raising an exception will result in the deletion of the resource.

Parameters

context PortContext instance describing the port.

create_port_precommit(*context*)

Allocate resources for a new port.

Create a new port, allocating resources as necessary in the database. Called inside transaction context on session. Call cannot block. Raising an exception will result in a rollback of the current transaction.

Parameters

context PortContext instance describing the port.

create_subnet_postcommit(*context*)

Create a subnet.

Called after the transaction commits. Call can block, though will block the entire process so care should be taken to not drastically affect performance. Raising an exception will cause the deletion of the resource.

Parameters

context SubnetContext instance describing the new subnet.

create_subnet_precommit(*context*)

Allocate resources for a new subnet.

Create a new subnet, allocating resources as necessary in the database. Called inside transaction context on session. Call cannot block. Raising an exception will result in a rollback of the current transaction.

Parameters

context SubnetContext instance describing the new subnet.

delete_network_postcommit(*context*)

Delete a network.

Called after the transaction commits. Call can block, though will block the entire process so care should be taken to not drastically affect performance. Runtime errors are not expected, and will not prevent the resource from being deleted.

Parameters

context NetworkContext instance describing the current state of the network, prior to the call to delete it.

delete_network_precommit(*context*)

Delete resources for a network.

Delete network resources previously allocated by this mechanism driver for a network. Called inside transaction context on session. Runtime errors are not expected, but raising an exception will result in rollback of the transaction.

Parameters

context NetworkContext instance describing the current state of the network, prior to the call to delete it.

delete_port_postcommit(*context*)

Delete a port.

state of the port, prior to the call to delete it. Called after the transaction completes. Call can block, though will block the entire process so care should be taken to not drastically affect performance. Runtime errors are not expected, and will not prevent the resource from being deleted.

Parameters

context PortContext instance describing the current state of the port, prior to the call to delete it.

delete_port_precommit(*context*)

Delete resources of a port.

Called inside transaction context on session. Runtime errors are not expected, but raising an exception will result in rollback of the transaction.

Parameters

context PortContext instance describing the current state of the port, prior to the call to delete it.

delete_subnet_postcommit(*context*)

Delete a subnet.a

Called after the transaction commits. Call can block, though will block the entire process so care should be taken to not drastically affect performance. Runtime errors are not expected, and will not prevent the resource from being deleted.

Parameters

context SubnetContext instance describing the current state of the subnet, prior to the call to delete it.

delete_subnet_precommit(*context*)

Delete resources for a subnet.

Delete subnet resources previously allocated by this mechanism driver for a subnet. Called inside transaction context on session. Runtime errors are not expected, but raising an exception will result in rollback of the transaction.

Parameters

context SubnetContext instance describing the current state of the subnet, prior to the call to delete it.

get_allowed_network_types(*agent*)

Return the agents or drivers allowed network types.

For example: return (flat,). You can also refer to the configuration the given agent exposes.

get_mappings(*agent*)

Return the agents bridge or interface mappings.

For example: agent[configurations].get(bridge_mappings, {}).

try_to_bind_segment_for_agent(*context, segment, agent*)

Try to bind with segment for agent.

Parameters

- **context** PortContext instance describing the port
- **segment** segment dictionary describing segment to bind
- **agent** agents_db entry describing agent to bind

Returns

True iff segment has been bound for agent

Neutron segments api-ref:

<https://docs.openstack.org/api-ref/network/v2/#segments>

Example segment dictionary: {segmentation_id: segmentation_id, network_type: network_type, id: segment_uuid}

Called outside any transaction during bind_port() so that derived MechanismDrivers can use agent_db data along with built-in knowledge of the corresponding agents capabilities to attempt to bind to the specified network segment for the agent.

If the segment can be bound for the agent, this function must call context.set_binding() with appropriate values and then return True. Otherwise, it must return False.

update_network_postcommit(*context*)

Update a network.

Called after the transaction commits. Call can block, though will block the entire process so care should be taken to not drastically affect performance. Raising an exception will cause the deletion of the resource. update_network_postcommit is called for all changes to the network state. It is up to the mechanism driver to ignore state or state changes that it does not know or care about.

Parameters

context NetworkContext instance describing the new state of the network, as well as the original state prior to the update_network call.

update_network_precommit(*context*)

Update resources of a network.

Update values of a network, updating the associated resources in the database. Called inside transaction context on session. Raising an exception will result in rollback of the transaction. update_network_precommit is called for all changes to the network state. It is up to the mechanism driver to ignore state or state changes that it does not know or care about.

Parameters

context NetworkContext instance describing the new state of the network, as well as the original state prior to the update_network call.

update_port_postcommit(*context*)

Update a port.

Called after the transaction completes. Call can block, though will block the entire process so care should be taken to not drastically affect performance. Raising an exception will result in the deletion of the resource. update_port_postcommit is called for all changes to the port

state. It is up to the mechanism driver to ignore state or state changes that it does not know or care about.

Parameters

context PortContext instance describing the new state of the port, as well as the original state prior to the update_port call.

update_port_precommit(*context*)

Update resources of a port.

Called inside transaction context on session to complete a port update as defined by this mechanism driver. Raising an exception will result in rollback of the transaction. update_port_precommit is called for all changes to the port state. It is up to the mechanism driver to ignore state or state changes that it does not know or care about.

Parameters

context PortContext instance describing the new state of the port, as well as the original state prior to the update_port call.

update_subnet_postcommit(*context*)

Update a subnet.

Called after the transaction commits. Call can block, though will block the entire process so care should be taken to not drastically affect performance. Raising an exception will cause the deletion of the resource. update_subnet_postcommit is called for all changes to the subnet state. It is up to the mechanism driver to ignore state or state changes that it does not know or care about.

Parameters

context SubnetContext instance describing the new state of the subnet, as well as the original state prior to the update_subnet call.

update_subnet_precommit(*context*)

Update resources of a subnet.

Update values of a subnet, updating the associated resources in the database. Called inside transaction context on session. Raising an exception will result in rollback of the transaction. update_subnet_precommit is called for all changes to the subnet state. It is up to the mechanism driver to ignore state or state changes that it does not know or care about.

Parameters

context SubnetContext instance describing the new state of the subnet, as well as the original state prior to the update_subnet call.

[networking_baremetal.common module](#)

`networking_baremetal.common.config_to_xml`(*config*)

```
networking_baremetal.common.driver_mgr(device_id)  
networking_baremetal.common.txt_subelement(parent, tag, text, *args, **kwargs)
```

networking_baremetal.config module

```
networking_baremetal.config.get_devices()
```

Get enabled network devices from configuration

This is called during driver initialization, during initialization additional driver specific configuration is loaded and the drivers validation method is called.

```
networking_baremetal.config.list_common_device_driver_opts()
```

```
networking_baremetal.config.list_opts()
```

networking_baremetal.constants module

```
class networking_baremetal.constants.NetconfEditConfigOperation(value)
```

Bases: Enum

RFC 6241 - <edit-config> operation attribute

The operation attribute has one of the following values:

merge: The configuration data identified by the element

containing this attribute is merged with the configuration at the corresponding level in the configuration datastore identified by the <target> parameter. This is the default behavior.

replace: The configuration data identified by the element

containing this attribute replaces any related configuration in the configuration datastore identified by the <target> parameter. If no such configuration data exists in the configuration datastore, it is created. Unlike a <copy-config> operation, which replaces the entire target configuration, only the configuration actually present in the <config> parameter is affected.

create: The configuration data identified by the element

containing this attribute is added to the configuration if and only if the configuration data does not already exist in the configuration datastore. If the configuration data exists, an <rpc-error> element is returned with an <error-tag> value of data-exists.

delete: The configuration data identified by the element

containing this attribute is deleted from the configuration if and only if the configuration data currently exists in the configuration datastore. If the configuration data does not exist, an <rpc-error> element is returned with an <error-tag> value of data-missing.

remove: The configuration data identified by the element

containing this attribute is deleted from the configuration if the configuration data currently exists in the configuration datastore. If the configuration data does not exist, the remove operation is silently ignored by the server.

```
CREATE = 'create'
```

```
DELETE = 'delete'
```

```
MERGE = 'merge'  
REMOVE = 'remove'  
REPLACE = 'replace'
```

[networking_baremetal.exceptions module](#)

```
exception networking_baremetal.exceptions.DeviceConnectionError(**kwargs)  
    Bases: NeutronException  
    message = 'Driver failed connecting to device %(device)s: %(err)s'  
  
exception networking_baremetal.exceptions.DriverEntrypointLoadError(**kwargs)  
    Bases: NeutronException  
    message = 'Failed to load entrypoint %(entry_point)s: %(err)s'  
  
exception networking_baremetal.exceptions.DriverValidationrror(**kwargs)  
    Bases: NeutronException  
    message = 'Failed driver validation for device %(device)s: %(err)s'  
  
exception networking_baremetal.exceptions.PreConfiguredAggregateNotFound(**kwargs)  
    Bases: NeutronException  
    message = 'Driver could not find the aggregate ID for the pre-configured  
    link aggregate for links %(links)s on device %(device)s.'
```

[networking_baremetal.ironic_client module](#)

```
networking_baremetal.ironic_client.get_client()  
    Get an ironic client connection.  
networking_baremetal.ironic_client.get_session(group)  
networking_baremetal.ironic_client.list_opts()
```
